What this standard covers

This standard specifies the general requirements for the performance, reliability and safety characteristics of alarm transmission systems. This standard covers the general requirements for providing a signal connection between an alarm system and an alarm receiving center. Additional requirements for specific alarm transmission systems are given in other chapters and are part of the GA/T 600. This does not preclude the use of transmission systems not covered by these specific sections, which may actually be used as long as it satisfies the general requirements. This standard does not provide for the methods and equipment for the installation of information notices.

Document data

International classification (ICS): 13.320.

Chinese classification (CCS): A91.

Estimated length of the Chinese original: 10,168 words.

Adopted international standard: IEC 60839-5-1-1991, IDT.
