What this standard covers

This standard specifies a uniform method for ground vehicles mechanical vibration presentation of data, and describes the basic content of instrumentation systems and test conditions, the test vehicle and operating conditions, and also provides the basic parameters of the analysis of the content of the test data processing. This standard applies to ground vehicles and operating machinery (and their components) for structural testing, and is suitable for measuring the vibration of the vehicle an occupant interface presentation process. This standard applies to the measurement of the original records, but also for the valuation, the report summary, comparison, or edit measurement data from the original records or other publications. This standard does not apply to statements derived from the measured data of any kind, or other power system transfer function characteristics.

Document data

International classification (ICS): 17.16.

Chinese classification (CCS): T04.

Estimated length of the Chinese original: 11,194 words.

Adopted international standard: ISO 8002-1986, MOD.
