What this standard covers

This standard specifies the various types of machinery and equipment for the determination of sound power levels using a series of standard guidelines. This standard includes: a concise summary of these basic standards, suited to a particular type of measurement of one or more standard selection criteria (see Chapter 5 and Appendix D). This criterion applies only to airborne sound. Term noise test range (see GB/T 19052) preparation, and there is no specific test specification noise measurement. This standard does not replace the other basic standards set forth in the various measurement methods in any detail or any additional requirements. These basic standards suitable for different environments and accuracy measured acoustic requirements. Follow these basic standards, the development of various types of machinery and equipment specialized test specification is very important. These noise test specifications will be on an installation of certain types of equipment condition gives detailed requirements and recommend the use of basic standards. If a particular type of machine is no specific noise test specification, then this standard can be used as the basis for the most suitable standard Selection Guide. In any case, the installation of the machine under test conditions and working conditions should be consistent with these basic standards of basic principles.

Document data

International classification (ICS): 17.140.

Chinese classification (CCS): A59.

Estimated length of the Chinese original: 28,216 words.

Adopted international standard: ISO 3740-2000, MOD.

Supersedes the earlier edition GB/T 14367-1993.
