No connection third session service primitives defined 51 this standard was first published in 1994.

GB/T 15128-2008/ISO/IEC 8326:1996

Introduction

This standard is one of a set of standards in order to facilitate the development of computer systems interconnection.

It is a set of standards and open systems interconnection (OSI) reference model as defined by other standards related. OSI reference model to interconnect standard Normalized range subdivided into a series of manageable size specification layer.

The purpose of this standard is on the boundary of the session layer and the presentation layer reference model between the provision of services to the presentation layer is defined. meeting Then use the transport layer protocol services to provide session services. This standard also defines the protocol can take advantage of the characteristics of the session services. Figure 1 it illustrates the relationship between session service, session protocol, transport services and representation agreements between each standard.

Diagram 1 OSI standards and other standards About session quality of service of this standard as described in Chapter 10, to recognize that, in order to pass through the Open Systems Interconnection (OSI) Reference Model Session quality of service of a comprehensive treatment of all layers, and each layer to ensure that their treatment and services to achieve the quality of services by a uniform manner (QOS) of the overall goal of the work is still in progress. Therefore, the future can add a Supplement to this standard, further reflecting the service Quality and comprehensive development.

GB/T 15128-2008/ISO/IEC 8326:1996 Information technology - OSI Session service definition the first chapter outlines

1 Scope

This standard uses the following terms and abstract methods defined externally visible service provided by the OSI Session Layer.
