What this standard covers

This standard specifies the method for measuring the tensile deformation under repeated fatigue resistance in vulcanized rubber. In the sample size and the cycle frequency basically unchanged or no temperature conditions leading to crack growth defects, and finally to the specimen fracture. This method is suitable for the stress-strain properties of rubber stable, at least in a certain period after the loop, did not exhibit undue stress softening or permanent deformation, or high viscous state.

Document data

International classification (ICS): 83.060.

Chinese classification (CCS): G40.

Estimated length of the Chinese original: 16,124 words.

Adopted international standard: ISO 6943-2007, IDT.

Supersedes the earlier edition GB/T 1688-1986.
