What this standard covers

This standard applies to the achievement of externally visible functions and conformance requirements specified. In full compliance with the standard ISO protocol stack, based on the detailed provisions of the control center via WAN and LAN inter- exchange real-time data. It centralized or distributed architecture can provide support. This standard covers the exchange of data including real-time data signals, control operations, time-series data, scheduling, electricity billing information, remote process control and event notification and other types. Although the original intention was to provide TASE. 2 data exchange between the control center method, but its use is not limited to this, it can be applied to other areas with similar requirements, such as: power plants, factory automation, process control automation. This standard specifies neither the specific implementations or products, nor the entities within the computer system implementation and interface restrictions.

Document data

International classification (ICS): 33.200.

Chinese classification (CCS): F21.

Estimated length of the Chinese original: 122,194 words.

Adopted international standard: IEC 60870-6-503-1997, IDT.
