What this standard covers

This standard specifies the determination of anti-absorbent fabric absorption spectrometry method using flip. This standard applies to all fabrics with or without waterproof or water repellent finishing finishing, especially for the determination of the waterproofing effect fabric after finishing, because the dynamic conditions of the method is similar to the fabric to withstand actual use. The method used to determine the water absorption resistance of the fabric, clothing may also be used to predict actual use resulting in weight gain. This method is ideal for taking the fabric in the humid environment for a long time use. This method can not be used to predict the penetration of water proof fabric, because the method measures the amount of moisture permeation through human rather than the amount of water absorbed by the fabric.

Document data

International classification (ICS): 59.080.30.

Chinese classification (CCS): W04.

Estimated length of the Chinese original: 6,634 words.

Adopted international standard: ISO 18696-2006, IDT.
