What this standard covers

This standard specifies the determination of earthmoving machinery machine liquid systems (engines, transmission, fuel system, oil systems, etc.) when operating laboratory testing method Static ramp capabilities. Ramp limit earthmoving machinery liquid system operations is the ability to assess the performance of static ramp parameters. The preferred method is to test the static capacity of the ramp on the machine or on a special platform inclined ramp, is another alternative method for the liquid test bench test system. Each method of ensuring safety measures should have, This standard applies to GB/T 8498 defined and install a standard earthmoving machinery working device.

Document data

International classification (ICS): 53.100.

Chinese classification (CCS): P97.

Estimated length of the Chinese original: 6,658 words.

Adopted international standard: ISO 10266-1992, IDT.
