Introduction

Climate change caused by human activities has been recognized as one of the greatest challenges facing the world and will continue to occur in the coming decades.

Climate change will have an impact on human and natural systems and will have an impact on resource availability, economic activities and human In response, relevant international organizations, countries and regions are formulating and implementing international, regional, national and local The United Nations is working to develop a green house gas emissions management program to reduce greenhouse gas (GHG) concentrations in the Earth's atmosphere and help humanity adapt to climate change.

Greenhouse gas emission management plans need to be based on the best scientific knowledge and take effective and progressive measures to address the impacts of climate change.

Standards help transform this scientific knowledge into tools to address climate change. Greenhouse gas emissions management programs rely on Relies on the quantification, monitoring and reporting of greenhouse gases.

GB/T 32151 specifies the requirements for greenhouse gas emissions accounting and reporting at different enterprise levels.

Enterprises shall specify their greenhouse gas emission boundaries, measurement, monitoring and testing requirements, accounting steps and methods, data quality management, reporting Content and format, etc. GB/T 32151 is intended to be divided into the following parts.

- Part 1: Power generation enterprises;
- Part 2: Grid enterprises;
