1 Scope

GB/T 42571-2023 applies security requirements to the operator of a blockchain information service rather than to the chain itself. The distinction matters. A blockchain's own guarantees are narrow and well understood: once a record is written and confirmed, altering it is impractical. Almost everything a user actually depends on lies outside that guarantee - how the information was generated before it was written, who was allowed to submit it, how it is processed and released, how it propagates, and what happens to the keys that authorise all of it. This document specifies the security technical requirements and the security management requirements for blockchain information service providers, and describes the corresponding testing and evaluation methods. It opens with an overview of what such services are and of the security risks that attach to them, then sets out the technical requirements along the life of the information - generation, processing, release, dissemination - before turning to the management side. It applies to the secure construction, operation, management and assessment of blockchain information services. Under ICS 35.030 and CCS L80, it is the reference for service providers registering under China's blockchain information service rules and for the assessors who examine them.

This document specifies the security technical requirements and security management requirements for blockchain information service providers, and describes the corresponding testing and evaluation methods: and check assessment methods: This document applies to services such as security construction, security operation, security management, and security assessment for blockchain information services:

2 Normative references

The contents of the following documents constitute the essential provisions of this document through normative references in the text: Among them, dated references For documents, only the version corresponding to the date is applicable to this document; for undated reference documents, the latest version (including all amendments) is applicable to this document: GB /Z 20986-2007 Guidelines for Classification and Classification of Information Security Technology and Information Security Incidents

GB/T 25069-2022 Information Security Technical Terminology

GB/T 32915-2016 Binary sequence randomness detection method for information security technology

GB/T 35273-2020 Personal Information Security Specifications for Information Security Technology

3 Terms and Definitions

Defined in GB/T 25069-2022, GB/T 35273-2020 and GB/T 40645-2021 and the following terms and definitions apply in this document: 3:

1 Based on blockchain technology or systems, information services provided through internet sites, applications and other network platforms: 3:

2 Organizations or individuals using blockchain information services:

Note: Blockchain information service users are referred to as "users": 3:

3 An organization that provides blockchain information services to blockchain information service users:

Note: Blockchain information service providers include but are not limited to blockchain business operators and blockchain technology providers: 3:4 timestamp timestamp The data obtained by signing the time and other data to be signed, and used to indicate the time attribute of the data:
