Foreword

This document complies with the provisions of GB/T 1.1-2020 "Standardization Work Guidelines Part 1: Structure and Drafting Rules of Standardization Documents". Drafting.

This document is Part 7 of GB/T 44887 "Technical Requirements for IPv6 Evolution". GB/T 44887 has already published the following parts.

- Part 1: Reference Architecture;
- Part 2: IP Bearer Networks Based on IPv6 Segment Routing (SRv6);
- Part 3: IPv6 Segment Routing Header (SRH);
- Part 4: Network Programming Based on IPv6 Segment Routing (SRv6);
- Part 5: Virtual Private Networks (VPNs) Based on IPv6 Segment Routing (SRv6);
- Part 6: IPv6 Segment Routing (SRv6) Policy;
- Part 7: Service Chaining Based on IPv6 Segment Routing (SRv6);
- Part 8: Packet Header Compression Based on IPv6 Segment Routing (SRv6);

- Part 9: Network Fault Protection Based on IPv6 Segment Routing (SRv6);
- Part 10. Enhanced Virtual Private Networks (VPNs) Supporting IP Network Slicing;
- Part 11. IPv6 Flow Detection Technology.

Please note that some content in this document may involve patents. The issuing organization of this document assumes no responsibility for identifying patents.

This document was proposed by the Ministry of Industry and Information Technology of the People's Republic of China.

This document is under the jurisdiction of the National Telecommunications Standardization Technical Committee (SAC/TC485).

This document was drafted by: China United Network Communications Group Co., Ltd., China Mobile Communications Group Co., Ltd., and China Information and Communication Research Institute.

Research Institute, Huawei Technologies Co., Ltd., ZTE Corporation, China Information and Communication Technology Group Corporation, H3C Technologies Co., Ltd.

Company, China Mobile (Hangzhou) Information Technology Co., Ltd.

The main drafters of this document are: Pang Ran, Cao Chang, Liu Yisong, Gao Wei, Liu Yan, Huang Hongyi, Peng Shuping, Chen Ran, Wang Junfang, Liu Jianhua, and Cheng Zhen.

Wan Xiaolan, Liu Wenbin, Liang Fang.

Introduction

According to the "Notice on Accelerating the Large-Scale Deployment and Application of Internet Protocol Version 6 (IPv6)," in order to accelerate the transformation of government applications, To expand industry integration and application, and to promote the standardization of large-scale IPv6 deployment and application innovations, China has formulated a series of IPv6 standards. Among them, GB/T 44887, "Technical Requirements for IPv6 Evolution," is designed to standardize the national IPv6 deployment and is proposed to consist of eleven parts.

- Part 1: Reference Architecture. The purpose is to define the application scenarios of IPv6 evolution technology in the operator and industry sectors, and in...

Deployment in carrier and industry networks.

- Part 2: IP Bearer Networks Based on IPv6 Segment Routing (SRv6). The purpose is to define IP bearer networks based on SRv6.

Overall architecture, SRv6-based device layer technical requirements, and SRv6-based

control layer technical requirements.

- Part 3: IPv6 Segment Routing Header (SRH). The purpose is to define the format of the IPv6 segment routing header (SRH), and...

SRH's technical requirements for node processing.

- Part 4: Network Programming Based on IPv6 Segment Routing (SRv6). The purpose is to define the data platform for SRv6 network programming.

Surface, control plane, management plane.

- Part 5: Virtual Private Networks (VPNs) Based on IPv6 Segment Routing (SRv6). The purpose is to define SRv6-based VPNs.

The network processing flow and protocol messages include the implementation of Layer 3 services and Layer 2 services.

- Part 6: IPv6 Segment Routing (SRv6) Policy. The purpose is to define SRv6 policies, SRv6 policy routing, and SRv6 policy...

The technical requirements for protection are used to support the development, design, and testing of network devices based on SRv6 policy technology.

- Part 7: Service Chaining Based on IPv6 Segment Routing (SRv6). The purpose is to define the data plane of SRv6-based service chains.

And control plane technical requirements, used to support the development, design and testing of network devices based on SRv6 packet header compression.

- Part 8: Packet Header Compression Based on IPv6 Segment Routing (SRv6). The purpose is to define the segment identifier structure for SRv6 header compression.

Requirements such as structure, data plane forwarding, control plane protocol extension, cross-domain deployment, and protection are designed to support SRv6-based packets.

The development, design, and testing of header-compressed network devices.

- Part 9: Network Fault Protection Based on IPv6 Segment Routing (SRv6). The purpose is to specify SRv6BE links/nodes, SRv6 specifies the technical requirements for SRv6 network fault protection, including intermediate nodes, tail nodes, micro-loop prevention, and end-to-end SRv6.

The development, testing, and deployment of equipment with network protection functions in SRv6 networking scenarios, addressing fault scenarios such as node/link failures.

Signatures, etc.

- Part 10: Enhanced Virtual Private Networks (VPNs) Supporting IP Network Slicing. The purpose is to define enhanced virtual private networks (VPNs).

The technical architecture of VPN, VPN technical requirements, and the VPN implementation process based on SR.

- Part 11. IPv6 Flow-Based Inspection Technology. The purpose is to specify data plane flow-based inspection technologies applicable to various service carrying scenarios.

The development, testing, and deployment of automated quality measurement of information, as well as the flow detection function of IP network devices.

IPv6 Evolution Technical Requirements Part 7: IPv6 Segment Routing (SRv6) business chain

1 Scope

This document specifies the data plane and control plane technical requirements for service chains based on IPv6 segment routing (SRv6), including service segments and SR...

Technical requirements include service strategy, SR agent behavior, metadata, BGP-LS extension, and business chain integration of NSH and SRv6.

This document applies to routers, switches, and VNFs that support service chaining functionality based on IPv6 segment routing (SRv6). Research and development.

3 Terms and Definitions

The terms and definitions defined in GB/T 44887.1 and the following terms and definitions apply to this document.

3.1 SR-aware service

The service is fully capable of handling SR traffic.

Note. SR-aware services are directly associated with the business segment.

3.2 SR-unaware service

The service is unable to process SR traffic, or the presence of SR information in the packet header may lead to incorrect processing.

Note. The SR-unaware service is associated with the business segment through the SR agent method.
