What this standard covers

This standard specifies test methods for determining the fire resistance of beams should be followed. Typically bottom and sides of the beam is affected by the fire. When the beam is surrounded on three sides by fire or less affected by the fire, under fire conditions should make the necessary change. As part of the floor beam structure, should GB/T 9978. 5 floor structure and the corresponding provisions of the joint trial. And evaluated its completeness and/or insulation. When the structure untested building components meet the conditions given direct application of the provisions of this section, the fire tests have been carried out by members of the section provides that the fire resistance of the results can be applied to similar untested building components. General Guide This part of the test methods in Appendix A.
