What this standard covers

This standard specifies two methods for measuring the melting point of polyamide. Is an arbitrary melting point temperature measured with the fact that it has a range of temperatures. For a homopolymer concerned, this range is only a few degrees. Determination of the melting point of the polyamide oligomer are useful to characterize, and is less useful for the purposes of the copolymer, the copolymer due to the melting range may be quite wide. Both methods described in this standard, which is very close to any of the test results, the results once the two methods is also extremely consistent. This method differs from the other two methods may give very different results.

Document data

International classification (ICS): 83.08.

Chinese classification (CCS): G32.

Estimated length of the Chinese original: 9,968 words.

Adopted international standard: ISO 1218-1975, IDT.
