Foreword

QB/T 4762-2026 is a recommended industry standard of the People's Republic of China in the Light Industry sector, approved and issued by the Ministry of Industry and Information Technology on 13 February 2026, with effect from 1 September 2026.

This edition replaces QB/T 4762-2014.

Classification: ICS 85.060; CCS Y32.

1 Scope

QB/T 4762-2026 concerns pasting paper for lead-acid batteries, the paper used in making the plates of lead-acid storage batteries. It is a product standard, so it deals with this paper as a material that is supplied to battery makers. The document covers the paper named in its title and does not go beyond that material. Lead-acid batteries are the rechargeable batteries widely used for vehicle starting and stand-by power, and the paper is one of the components used in the production of their plates.

Paper mills producing this grade, lead-acid battery manufacturers who purchase it, and laboratories that examine it would use the standard. It is voluntary, as shown by the /T in the code. The Ministry of Industry and Information Technology issued it on 13 February 2026, and it takes effect on 1 September 2026. It replaces QB/T 4762-2014.
