What this standard covers

This standard specifies the various types of metrics required in software project metrics. The software item metric element divides the basic information metric element and the specific metric element. The basic information metric element is used as the basis of the metric to define the software factors and development factors involved in the software project metric. This metric element is obtained directly during the project planning phase. The division principle of a specific metric element is divided into five categories according to size, resources and cost, schedule, process efficiency, and quality. Specific metrics are usually acquired during software project development and operation and maintenance services.

Document data

Chinese classification (CCS): L77.
