What this standard covers

This standard specifies the sampling method for the detection and enumeration of just-slaughtered carcasses on the carcass surface. The microbiological sampling method specified in this standard applies to: - cattle, horses, pigs, sheep, goats and artificially raised wild animals. Process control on the slaughter line; - a risk assessment system based on product safety; - a regulatory plan for the prevalence of pathogenic microbes. This standard includes the use of destructive or non-destructive techniques for sample collection for different uses. This standard does not take into account the use of sampling plans. When the content of this standard is in conflict with national regulations, it is carried out in accordance with national regulations.
