What this standard covers

This standard specifies a transmission protocol that can ensure link reliability under extreme link conditions: extreme long RTT or frequent connection interruptions, the LTP protocol. With the help of the stateful automatic retransmission mechanism, the LTP protocol can work on the data link layer in the network environment where the Bundle Protocol is deployed, provide reliable data transmission services, and ensure the integrity of data transmitted between communication entities. This standard is applicable to interstellar network communication with ultra-long distance and large delay.
