What this standard covers

This standard specifies the method for determining the content of silver, cadmium, manganese, copper, bismuth, aluminum, nickel, tin, magnesium, zinc, arsenic, antimony, and iron in high-purity lead using inductively coupled plasma mass spectrometry. This standard applies to the determination of metallic impurity content in high-purity lead.

Document data

International classification (ICS): 77.120.60.

Chinese classification (CCS): H13.

Estimated length of the Chinese original: 14,195 words.

Supersedes the earlier edition YS/T 229.1-2013.
